BRANDTRACK 360 | BrandwatchAfrica

User Journey: Plus FM

From sign-up to daily power use, followed through a real customer persona

Kwame is the communications manager at **Plus FM**, a busy Accra radio station that needs to know what its audience, competitors and advertisers are hearing and saying about its brand, across radio, news and social. What follows is his path through BrandTrack 360 from the first sign-up screen to daily power use. Every screen and route named below (shown as **#hash-route**) is a real, existing part of the product; this is a description of the built application, not a concept.

1 Sign Up (First Five Minutes)

1.1 Landing on the sign-up page

Kwame lands on **#auth/register**. The left panel makes the pitch: track 500-plus radio stations, news sites and social channels; AI sentiment scoring in twelve African languages; a community risk heatmap across 54 countries; ESG and regulatory reporting built for African markets.

“Start monitoring your brand across Africa in minutes.”

A testimonial from the Head of Comms at Ashanti Gold Corp backs it up: “We caught three issues before they became crises.” The offer: a 14-day free trial, no credit card required.

1.2 Filling the form

Kwame fills in his name, work email (**kwame@plusfm.gh**), and a password that has to carry one lowercase letter, one uppercase, one number and one symbol. He confirms it, picks Ghana and Greater Accra from the country and region fields, and adds a phone number, flagged as used for critical SMS alerts. He ticks off the Terms of Service and Privacy Policy (both real pages, at **#legal/terms** and **#legal/privacy**) and hits Create account.

If Plus FM had instead been invited by an existing customer, Kwame’s email would already be filled in and locked, an invite code would apply itself, and he’d skip straight to joining the organisation.

1.3 Account created, security next

The account is created through **/api/auth/register**, and Kwame lands on **#auth/mfa-setup** to set up multi-factor authentication, since everything from here on runs inside what the product calls an Enterprise Session. Behind the scenes, the app signs him in and quietly registers a push subscription through the Service Worker, so Plus FM can receive real-time alerts without any further setup.

2 Profile & Organisational Setup

2.1 Profile setup

At **#auth/profile-setup**, Kwame completes his profile. Had he come in through a teammate’s invite, this step would have auto-processed instead, landing him on a queue of relevant mentions from day one; the onboarding adjusts to how someone arrived.

2.2 Organisation setup

At **#auth/org-setup** comes the key decision: create or join an organisation. Kwame chooses **Create**, names it Plus FM, and sets the organisation type to news/broadcast. The screen invites him to add teammates by email right away, each of whom gets a guided setup of their own; he can do that

now or leave it for Settings → Team later. He invites his news editor and his marketing lead.

2.3 Onboarding survey

Before the dashboard appears, `#onboarding/survey` asks Plus FM to describe its coverage priorities, the channels it cares about, and how it wants to work. That answer shapes whether the workspace opens in simplified or advanced view, and how role-aware the rest of the setup is.

3 First Login: The Dashboard

Onboarding ends at `#dashboard/executive`, the default landing screen and effectively mission control. A global radio widget lets Kwame's team actually listen to monitored stations from inside the browser. The right sidebar, holding Quick Actions, the calendar, time management and Team Chat, auto-expands on dashboard routes. The left Sidebar exposes the rest of the product, with a Simplified/Advanced toggle so Plus FM can start plain and grow into the deeper tooling later. From here, every major capability is one click away, and the rest of this journey is what Plus FM actually does with it day to day.

4 Building the Monitoring Workspace

4.1 Projects

At `#projects` and `#projects/new`, Kwame sets up a project called “Plus FM On-Air Brand”, the container that organises keywords, mentions, sources and alerts. Institutional plans support several projects at once, so a station could run one for its morning show and another purely for competitor tracking.

4.2 Keywords

At `#settings/keywords` he adds the terms that matter: “Plus FM”, “Plus 101.1”, his hosts' names, the station slogan, and the competitors he wants watched. These keywords are the core of the product; every mention that matches one feeds both the live feed and the AI brief's daily narration.

4.3 Connecting sources

At `#sources/connect`, Plus FM wires up the channels it wants watched: its own broadcast and competitor stations across Ghana under `#sources/radio` (all of which get transcribed), uploaded audio mapped for transcription under `#sources/upload`, and news sites or social channels through the source catalog. `#sources/health` lets Kwame confirm each source is actually syncing, and `#sources/map` shows a live map of where coverage is active.

5 The Day-to-Day Loop

5.1 The mention feed

Every mention of Plus FM across radio, news and social lands in one unified feed at `#mentions / #mentions/feed`. Kwame filters it with the Query Builder (`#mentions/query/builder`), saves the searches he reuses under `#mentions/query/details`, and opens any individual mention as a Mention Detail (`#sentiment/mention`) to see its sentiment, source and matched keyword. AI transcripts of radio broadcasts (`#mentions/transcripts`) let him revisit exactly what was said, on any station, at any time.

5.2 Sentiment & review

`#sentiment` gives the sentiment overview across all coverage. `#sentiment/review` is the Human Review Queue, where the team confirms or corrects the AI's sentiment calls so the model keeps

learning what Plus FM's brand actually sounds like. `#sentiment/assistant` is a Brand Assistant chat Kwame can ask plain-language questions of, and `#sentiment/tuning` and `#sentiment/ai-visibility` handle model tuning and how AI-generated coverage gets surfaced.

5.3 Topics, competitors & the knowledge graph

`#mentions/topics` groups mentions into themes like music, traffic, or advertiser backlash. `#mentions/competitors` is Competitor Benchmarking: Plus FM measured directly against its rival stations. `#mentions/knowledge-graph` visualises how entities and topics connect, and `#mentions/social` covers the social mentions graph and feed.

5.4 Community & field intelligence

This is the differentiator for a station with regional reach. `#community/heatmap` is a community risk heatmap across regions and countries; `#community/registry` lists the communities being monitored; `#community/observation` is where the team logs on-the-ground Field Observations tied back to specific mentions; and `#community/detail` drills into one community's sentiment on its own.

6 Staying Ahead: Alerts & the AI Daily Brief

6.1 Alerts

Plus FM can't watch the feed around the clock, so the system watches instead. At `#alerts/rules` Kwame builds Alert Rules, such as "alert me if Plus FM sentiment turns negative" or "flag it if a competitor station is mentioned alongside 'raid' or 'poach'", each scoped to the whole organisation or to a single project. `#alerts/queue` is the live queue the team triages, and `#alerts/incidents` is the Incident War Room: when something real breaks, say a rumour that Plus FM is changing frequencies, the team opens an incident, assigns owners, and manages it through to resolution.

6.2 The AI Daily Brief

Every morning, `#dashboard/ai-report` gives Plus FM an AI Daily Report: the previous 24 hours of coverage across every tracked keyword, narrated. Kwame can listen to it like a news bulletin, thanks to the AI writing paired with a neural-voice audio engine, and regenerate it with one click if he wants a fresh take. There's an org-level summary as well as a per-project brief, so each show lead gets their own morning rundown.

This is the feature that turns "a dashboard someone ignores" into "a briefing the boss actually hears on the drive to work."

7 Reporting & Proof

7.1 Reports

For advertisers, the board, and regulators, `#reports/builder` lets the team build custom reports, and `#reports/library` holds the exportable, white-label report library on institutional plans. `#reports/esg` covers ESG reporting, relevant to Plus FM's advertisers in mining and energy, and `#reports/regulatory` is a Regulatory Tracker for compliance and licensing coverage.

7.2 Calendar & day review

`#system/calendar-day` gives a per-day view tying mentions, alerts and briefs to a single date. `#dashboard/analyst` is the Analyst Workspace for deeper research, and `#dashboard/onboarding` holds the onboarding checklist that gets the rest of the team properly set up.

8 Platform Administration

8.1 The right sidebar

Quick Actions, the team calendar, time management, and Team Chat sit here, so collaboration never means leaving the app.

8.2 Settings & security

`#settings/user-profile` holds Kwame's profile and notification toggles. `#settings/team` is Manage Users, where he invites teammates, generates and copies invite codes, and sees who's still pending across Plus FM's three-person team. `#settings/roles` is Access Roles, role-based permissions where client-level roles are blocked from managing users or roles at all. `#settings/branches` handles branch and bureau management, useful for an Accra HQ with regional studios. `#settings/billing` is where the plan lives (Starter, Growth or Institutional) and where the 14-day trial counts down. `#settings/security` covers MFA, sessions and overall security posture. `#settings/integrations`, `#settings/quick-actions` and `#settings/app-preference` handle integrations, toolbar shortcuts and appearance. `#settings/keywords` manages the tracked keyword list, `#settings/audit-trail` is a full, compliance-ready Audit Trail of who did what, and `#settings/help` is help and support.

8.3 API & data

`#api/docs` documents the API, `#api/webhooks` lets Plus FM wire its own systems into events as they happen, and `#api/exports` handles raw data exports for advertisers or archives.

8.4 Notifications

`#system/notifications` is the full notification inbox: every push, email and SMS alert that ever fired, searchable.

9 Sign Out

When Kwame is done, he opens Sign out. A confirmation card appears, badged “BrandWatch Africa Enterprise Session”:

“Are you sure you want to sign out?” — “You’ll need to sign in again to access your workspace.”

He confirms, lands back on `#auth/login`, and can sign back in any time, straight back to his dashboard.

10 The Complete Flow at a Glance

Once inside the dashboard, everything else radiates out from it as a set of parallel workstreams rather than a fixed sequence. Plus FM moves between these freely, day to day:

11 What Plus FM Gets Out of It

1. **Total visibility.** Every mention of the Plus FM brand across radio, news and social lands in one feed, competitor benchmarking included.
2. **Never blindsided.** AI sentiment and alerts catch negative shifts early, and a real incident gets a war room instead of a scramble.
3. **A morning briefing they'll actually hear.** The narrated AI Daily Brief, regenerable, broken out per project.
4. **Proof for advertisers and the board.** Exportable reports, ESG and regulatory tracking, a full audit trail.
5. **Control and security.** MFA, role-based access, team invites, and an audit trail, all inside one enterprise session.
6. **Room to grow.** From Simplified to Advanced view, from a single project to Institutional multi-project use with sub-accounts and API/webhook integration.

User-journey narrative for BrandTrack 360 (BrandWatch Africa), following a Plus FM communications manager from first sign-up through daily power use. Every screen and route referenced reflects the existing product.
