

Topic 1: AI Doctors — Would You Trust a Diagnosis From a Machine?

The Big Picture

Artificial Intelligence is rapidly advancing in healthcare. However, major studies reveal a massive gap between a machine's book-smarts and real-world medical expertise. A 2025 meta-analysis in *Nature Digital Medicine* found that AI chatbots have an overall diagnostic accuracy of just **52.1%** (comparable to a coin toss) and trail expert specialist physicians by **15.8%**. Despite this, millions of people use platforms like ChatGPT daily for health advice, leading major health organisations to name AI chatbot misuse a top patient safety concern.

Key Talking Points for the Presenter

- **The Diagnostic Gap:** While AI can pass medical exams on paper, real diagnosing requires reading body language, hearing a patient's tone, and years of clinical intuition.
- **The Danger of "Self-Diagnosing":** Nearly 1 in 3 people say they would skip seeing a real doctor if an AI tool classified their symptoms as "low risk". This could lead to serious medical conditions being ignored.
- **The "Hallucination" Risk:** Medical watchdogs have documented instances where AI models confidently invented non-existent body parts or suggested dangerous device placements.
- **The Best-Case Scenario:** AI shouldn't *replace* doctors; it should *assist* them. When a human doctor uses AI to cross-reference data, the results are highly accurate.

Topic 2: The End of the "Human" Influencer? The Rise of AI Stars

The Big Picture

The creator economy is shifting as brands increasingly hire virtual influencers. These are hyper-realistic, entirely computer-generated avatars with complete backstories, consistent posting schedules, and millions of followers. For example, **Lil Miquela** (2.4M followers on Instagram) collaborates with brands like Prada and Calvin Klein. Another breakout star, **Aitana Lopez**, is a pink-haired AI model earning thousands of dollars per month through sponsorships—designed by her agency specifically to avoid "unreliable" real-life model behaviour.

Key Talking Points for the Presenter

- **Why Brands Love Them:** They have zero drama, require no travel budgets, don't demand breaks, and can be customised to match a brand's precise target audience.
- **The "Fakeness" Debate:** Can we truly connect with a creator who has never eaten the food they recommend, worn the shoes they model, or actually listened to the music they promote?
- **Threat to Local Creatives:** Young creators and models already face intense competition. If local brands start designing virtual models instead of hiring real ones, the creative gig economy could suffer.

 - **Visuals:** Show pictures of **Lil Miquela** and **Aitana Lopez** side-by-side. Have the hosts guess if they are real or fake!
 - **Social Media Poll:** *"Would you follow a virtual influencer? (Yes / Only if the content is good / No, it's weird)"*
-

Topic 3: AI Cupid — Is Using AI to Find Love Genius or "Chatfishing"?

The Big Picture

The dating world has a new term: **"Chatfishing"**. This is the practice of using AI "wingman" apps (like *Wingman AI*, *Winggg*, or *Casanova*) to craft witty pick-up lines, keep conversations going, or rewrite online dating bios. AI usage among singles has spiked dramatically, with nearly half of Gen Z dating app users turning to AI for romantic help. The ultimate catch? When you finally meet in person, the "personality plagiarism" is exposed, and the real-life conversation can't match the artificial wit.

Key Talking Points for the Presenter

- **Dating App Rizz-on-Demand:** Apps like *Winggg* analyze a match's profile to create personalized, clever openers so you don't have to overthink your messages.
- **The "Personality Plagiarism" Trap:** If your online humor is generated by an AI model, are you setting yourself up to fail when you finally meet face-to-face?
- **AI as a Relationship Therapist:** People are now uploading screenshots of their private WhatsApp or DM chats to AI tools to analyze their crush's "attachment style" or look for red flags.

On-Screen Graphics / Production Ideas

- **Headline Banner:** *Chatfishing: Are You Flirting with a Bot?*
 - **Visuals:** Display screenshots of typical generic texts versus AI-generated "Rizz" responses to show the difference.
 - **Social Media Poll:** *"Is using AI to text your crush a clever life hack or a complete lie? (Genius Hack / Dealbreaker)"*
-
