III.5

Criterion  
Look and Feel of the System

Design Philosophy

The GoldBod TAS interface is built around one operational principle: a GoldBod compliance officer should be able to identify a suspicious gold movement, trace it to its origin, and initiate a report without consulting a manual or requesting assistance. Every design decision prioritises task completion speed and information clarity over visual decoration.

The interface carries GoldBod's institutional identity — logo, gold and navy colour palette, professional typography — throughout all screens. It reads as a government regulatory platform, not a generic SaaS product.

Dashboard — Operational Command View

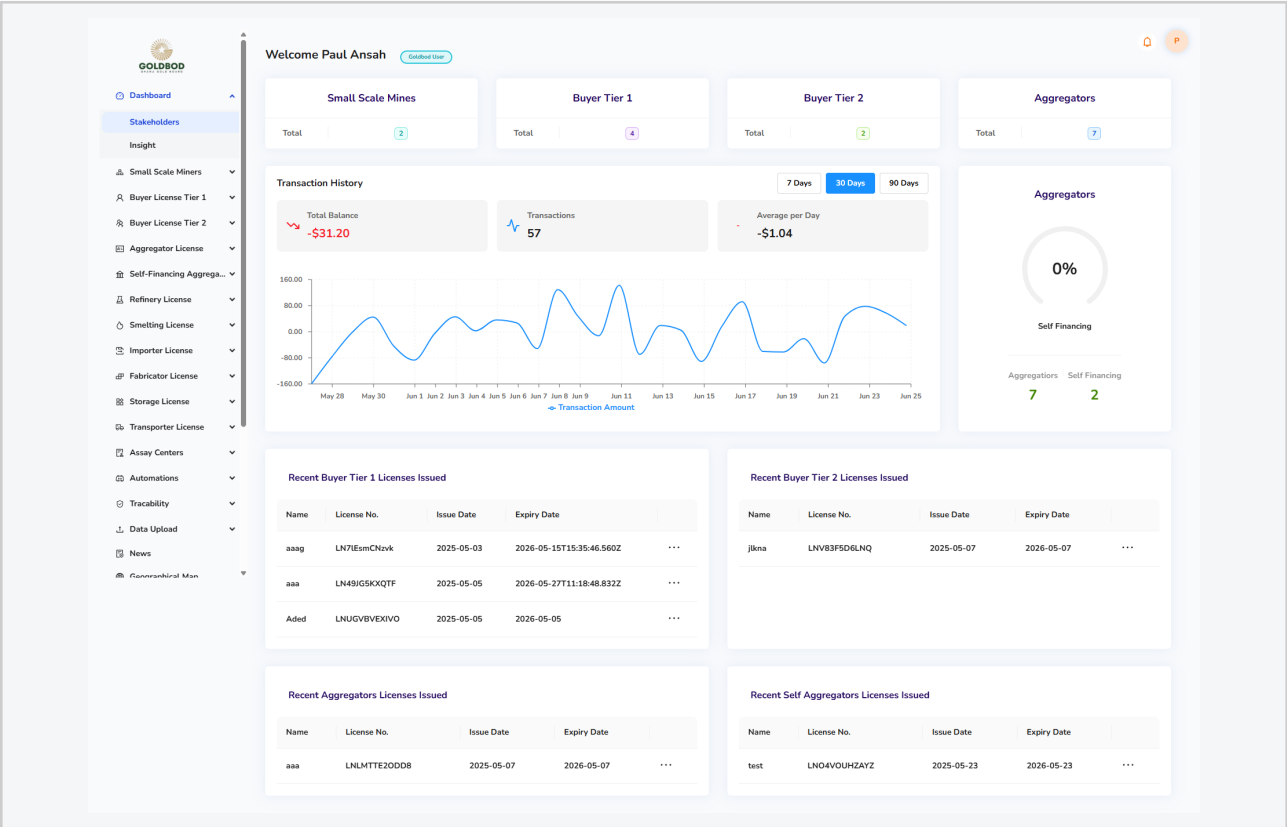

Figure 5 — GoldBod TAS Main Dashboard (Paul Ansah, Goldbod User). Card-based stakeholder census, 30-day transaction history chart with 7/30/90-day toggle, four parallel recent-licence tables, and Aggregator breakdown donut chart.

|                           |                                                                                                                                                                                                      |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Stakeholder summary cards | Four top-level metric cards give an instant census of active participants without navigating sub-menus. Current live values: Small Scale Mines 2, Buyer T1 4, Buyer T2 2, Aggregators 7.             |
| Transaction history chart | Line chart with 7/30/90-day date-range toggle. Active period highlighted in blue. Provides at-a-glance anomaly detection — spikes and unusual patterns visible immediately without running a report. |

|                        |                                                                                                                                                                                                        |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Recent licence tables  | Four parallel tables (Buyer T1, T2, Aggregators, Self-Aggregators) display the most recently issued licences with Name, Licence No., Issue Date, and Expiry Date. Overflow menu (■) for quick actions. |
| GoldBod brand identity | GoldBod logo anchors the sidebar. Gold and navy colour scheme reflects GoldBod's institutional identity throughout — appropriate for a government regulatory system presented to international buyers. |
| Navigation structure   | 15 top-level modules in a collapsible left sidebar, grouped by actor type. Logical structure mirrors GoldBod's operational categories. Collapse button maximises data-viewing area on demand.          |

Traceability Graph — Audit View

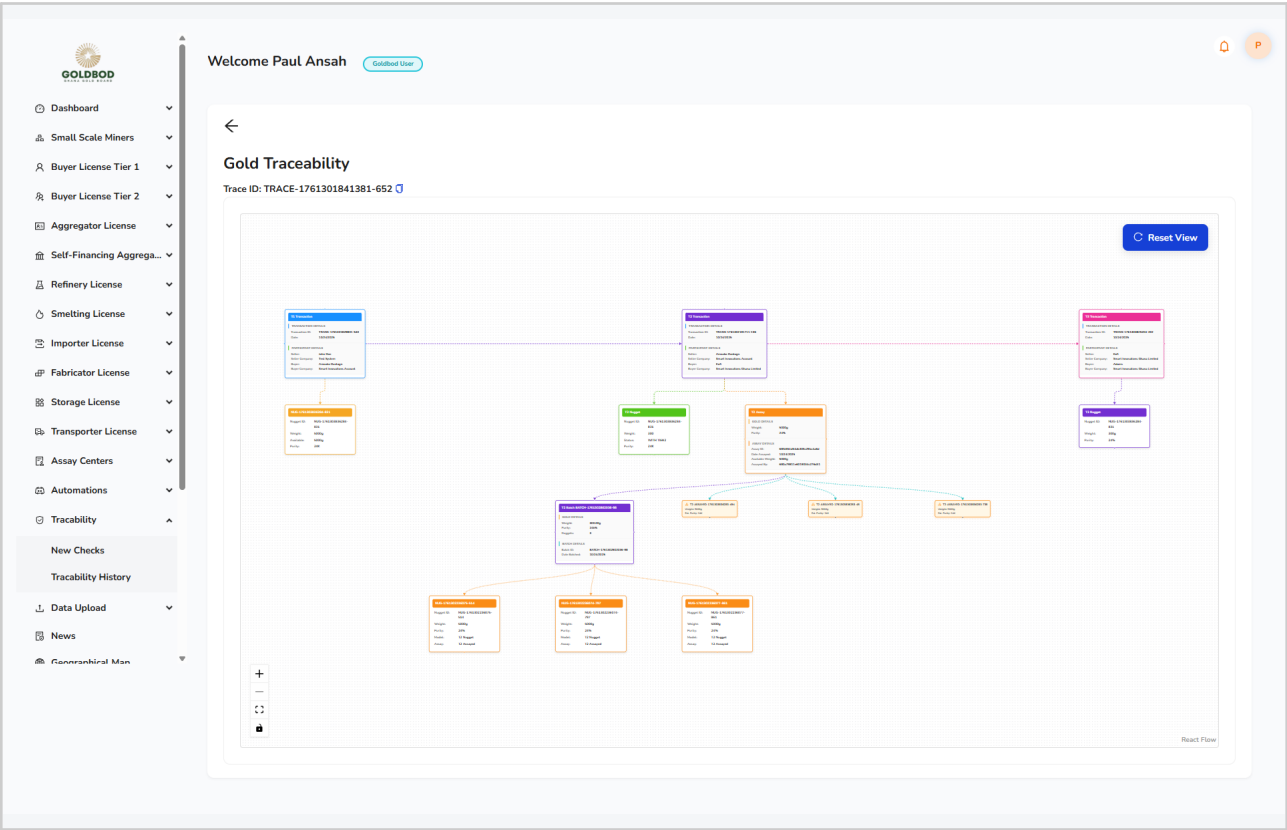

Figure 6 — Interactive Gold Traceability Graph (Trace ID: TRACE-1761301841381-652). Colour-coded actor nodes, directional custody flow arrows, pan/zoom/fullscreen controls, reset view button, copy Trace ID button. Each node shows weight, purity, provenance inline.

|                       |                                                                                                                                                                                              |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Colour-coded nodes    | Transaction nodes (blue/purple), Nugget nodes (orange), Kitchen/Batch nodes (green/purple). Actor type readable at a glance without reading node labels — critical for rapid audit scanning. |
| Directed graph layout | Custody flows top-to-bottom, left-to-right. Split paths (one lot → multiple nuggets) and merge paths (amalgamation) both rendered cleanly with directional arrows indicating flow direction. |
| Node detail cards     | Each node shows ID, weight, purity, provenance, transporter, buyer company inline — all critical audit data visible without expanding or clicking through to a detail view.                  |

|                      |                                                                                                                                                                  |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interactive controls | Zoom in/out (+/-), fullscreen expand, reset view, pan drag. Enables rapid navigation of complex custody trees. Keyboard-accessible for power users.              |
| Trace ID reference   | Unique Trace ID displayed with copy-to-clipboard button — can be pasted directly into STR/SAR reports, shared with FIC, or referenced in GoldBod correspondence. |

Accessibility & Usability

- Sufficient colour contrast for legibility in varied lighting — relevant for GoldBod field offices and outdoor environments.
- All interactive elements operable by keyboard in addition to mouse — accessibility compliance for all officer profiles.
- Responsive design adapts to 1920px (desktop workstation), 1366px (laptop), 768px (tablet). Field supervisors and district officers can use the platform on tablets without a separate mobile version.
- Language support: interface labels support localisation. Twi, Ga, Hausa, and English translations planned for field-facing mobile app screens — addressing the diverse linguistic profile of Ghana's ASM workforce.
- React Native mobile companion app (Android 8+) under development uses the same design language — visual consistency across web and mobile interfaces reduces training burden.
